READING PART 1

*Read the text. Fill in each gap with **ONE** word. You must use a word which is somewhere in the rest of the text*

THE OCEAN AND ITS SECRETS

The ocean is one of the most beautiful and powerful parts of our planet. People travel from around the world just to see the **1.** _____ and listen to its sounds. The deep blue ocean hides many secrets under its surface. Inside the ocean, there is always water moving. The **2.** _____ is salty and full of life. Without water, no sea animals could survive. Every fish, big or small, depends on clean water to live and breathe. There are millions of fish in the ocean. Some **3.** _____ are colorful and live near rocks, while others swim deep where it's dark and cold. Near the shore, we often see beautiful coral. Many fish hide in **4.** _____ to stay safe. Coral also helps protect the land from strong waves. The **5.** _____ in the ocean never stop. Small waves splash gently on the beach, while big waves crash loudly during storms. Sometimes, lucky people see dolphins jumping out of the water. **6.** _____ are smart and playful animals. They often swim near boats and follow the waves happily. People love watching dolphins in the wild.

READING PART 2

*Read the texts 7-14 and the statements A-J. Decide which text matches with the situation described in the statements. Each statement can be used **ONCE** only. There are **TWO** extra statements which you do not need to use. Mark your answers on the answer sheet.*

A. You are interested in learning about a planet that has rings made entirely of dust and rock.
B. You need information about the enormous atmospheric whirl nicknamed the Great Red Spot.
C. You hope to discover which world travels around the Sun lying almost sideways.
D. You are looking for details on the planet surrounded by brilliant icy bands.
E. You wish to study the extremely hot world hidden beneath dense, acidic clouds.
F. You must check which planet completes its solar circuit in just 88 Earth days.
G. You would like facts on the far-off blue giant famous for record-breaking winds.
H. You are curious about the small moon that may conceal a liquid ocean under frozen crust.
I. You want to find out which moon has active lava volcanoes erupting regularly.
J. You'd like to know which planet's rotation lasts almost the same length as an Earth day.

Teacher Jamshid

7. With a diameter little more than one-third of Earth's, this rocky world darts round the Sun faster than any other, completing its journey in just under three Earth months. Although days grow blisteringly hot and nights plummet far below freezing, it has almost no air to trap heat, leaving its sky jet-black even at noon.

8. Thick layers of carbon-dioxide gas and sulfuric droplets form a global shroud here. Surface pressure crushes at about ninety times Earth's, and temperatures soar high enough to melt lead. Sunlight does reach the ground, but it is scattered into a dim orange glow by the planet-wide haze.

9. Dust rich in iron minerals covers this desert realm, tinting its landscape a rusty brown. On its western hemisphere rises Olympus Mons, a shield structure so tall that its summit pokes above the thin atmosphere. Seasonal ice caps of frozen carbon dioxide retreat and advance each Martian year.

10. The Solar System's heavyweight sports multicoloured cloud belts and a colossal crimson vortex that has raged for centuries. Beneath the swirling upper layers lies a mantle of liquid metallic hydrogen generating an immense magnetic field and powerful auroras around the poles.

11. Composed mostly of hydrogen and helium, this gas giant is best known for its shimmering system of flattened debris made of water-ice fragments and dust. Dozens of moons orbit within and beyond these luminous structures, gently sculpting gaps and waves inside them.

12. Knocked over long ago, this pale cyan sphere spins almost on its side, causing each pole to experience decades-long stretches of sunlight followed by equal stretches of darkness. Methane gas high in the atmosphere absorbs red wavelengths, giving the planet its soft blue-green hue.

13. Far beyond the orbit of its cousin, this indigo giant endures winds that scream faster than the speed of sound on Earth. A mantle rich in slushy water and ammonia may surround a rocky core, while faint arc-shaped rings circle the planet at the equator.

14. Roughly the size of Earth's moon, this object is sheathed in cracked, bright ice criss-crossed by darker ridges. Tidal flexing from its giant host planet warms a hidden layer beneath the crust, and many scientists suspect a global briny sea that could harbour microbial life.

Teacher Jamshid

READING PART 3

Read the text and choose the correct heading for each paragraph from the list of headings below. There are more headings than paragraphs, so you will not use all of them. You cannot use any heading more than once. Mark your answers on the answer sheet.

GREEN SPACE

A) Air quality	**E)** Impact on climate regulation
B) Balance between development & nature	**F)** Biodiversity
C) Consequences of losing green space	**G)** Overlooked necessity
D) Social/emotional benefit	**H)** Accessibility and equity

15. As urban areas continue to expand, the disappearance of green spaces has become a growing concern. The removal of parks, forests, and natural landscapes not only reduces recreational opportunities but also contributes to urban heat islands, increased flooding, and a decline in overall well-being. Without access to nature, residents may experience both physical and psychological strain.

16. Green spaces play a crucial role in improving air quality by filtering pollutants and releasing oxygen. Trees absorb harmful gases such as carbon dioxide and nitrogen dioxide, helping to reduce respiratory problems and allergic reactions among city dwellers. Without sufficient vegetation, air pollution worsens, leading to serious public health concerns.

17. Natural environments offer more than aesthetic value; they provide essential emotional and social benefits. Studies have shown that spending time in green areas can significantly reduce stress, anxiety, and depression. Moreover, public parks foster social interaction and create a sense of community, which is vital in densely populated cities.

18. Urban green spaces are critical for preserving biodiversity. Even small areas of vegetation can support a wide range of species, from insects and birds to mammals and native plants. When these habitats are destroyed, the delicate balance of local ecosystems is disrupted, and many species face extinction or forced migration.

19. Despite its importance, green space is often undervalued during urban planning. While economic growth and infrastructure receive priority, the need for accessible natural areas is frequently neglected. Yet, green spaces are not a luxury — they are a necessity for sustainable and livable cities, promoting both environmental health and human well-being.

20. Striking a balance between urban development and environmental preservation is one of the greatest challenges of modern city planning. While economic expansion and housing are essential, they must not come at the cost of nature. Integrating green spaces into city designs ensures long-term sustainability and a higher quality of life for future generations.

READING PART 4

Read the following text for questions 21-29.

AI IN MODERN MEDICINE

Artificial Intelligence (AI) has begun to revolutionize the field of medicine, offering advanced tools to diagnose diseases, recommend treatments, and streamline healthcare systems. With the growing capacity of machines to process massive datasets, recognize patterns, and learn from experience, AI technologies are increasingly being integrated into both clinical and research settings.

One of the most significant applications of AI in medicine is medical imaging. Algorithms trained on thousands of radiological images can now detect abnormalities such as tumors, fractures, or infections with a level of accuracy that often matches or even surpasses that of experienced radiologists. These systems not only reduce the risk of human error but also speed up the diagnostic process, enabling earlier intervention and improved patient outcomes.

Another growing area is predictive analytics. AI tools can analyze a patient's medical history, genetic information, and lifestyle factors to estimate the likelihood of developing conditions like heart disease or diabetes. Such predictions allow for personalized treatment plans and preventive strategies tailored to individual patients, marking a shift from reactive to proactive healthcare.

AI is also proving valuable in drug discovery. Traditionally, developing new medicines takes many years and involves high costs. AI models can rapidly screen molecular compounds, identify potential drug candidates, and even suggest new uses for existing medications. This accelerates the research process and could lead to faster availability of life-saving treatments, especially in urgent public health situations like pandemics.

Despite these advancements, the use of AI in healthcare raises several ethical and practical concerns. One major issue is data privacy. AI systems often rely on sensitive patient data, and ensuring the confidentiality and security of that information is critical. There is also concern about algorithmic bias, where AI tools may unintentionally reflect social or demographic prejudices present in the training data. This could lead to unequal treatment recommendations or misdiagnoses, especially in underrepresented groups.

Another challenge is the question of responsibility. If an AI system makes a mistake—such as recommending an incorrect dosage or missing a serious condition—it remains unclear whether the liability lies with the software developer, the healthcare provider, or the institution using the technology. Clear legal and ethical frameworks are needed to define accountability in AI-assisted care.

In addition, there is a risk of overreliance on technology. While AI can assist medical professionals, it cannot replace human judgment, empathy, or the doctor-patient relationship. Many experts emphasize that AI should

Teacher Jamshid

serve as a support tool, rather than a decision-maker, ensuring that final medical choices remain in the hands of trained healthcare providers.

For questions 21-24, choose the correct answer A, B, C, or D. Mark your answers on the answer sheet.

21. What is one major advantage of AI in analyzing medical images?

A) It replaces the need for all human radiologists

B) It slows down the diagnostic process to avoid errors

C) It detects abnormalities as accurately—or more so—than human experts

D) It eliminates the need for physical radiological scans

22. What goal does AI pursue when analyzing a person's health history and lifestyle?

A) To delay treatment until more data is available

B) To predict future pandemics on a global scale

C) To estimate health risks based on personal data and promote preventive care

D) To automatically prescribe medication without doctor approval

23. How is AI making the process of creating new medications more efficient?

A) By increasing the prices of pharmaceutical research

B) By helping identify possible drugs more quickly and cost-effectively

C) By removing the need for lab trials entirely

D) By creating only plant-based medicines

24. What is a moral dilemma discussed in connection with using AI tools in medicine?

A) Lack of patient interest in using technology

B) High salaries for AI developers in hospitals

C) Risks of bias and privacy issues in patient data

D) Delays in diagnosing common diseases

For questions 25-29, decide if the following statements agree with the information given in the text. Mark your answers on the answer sheet.

25. AI can sometimes identify health problems in medical scans more accurately than doctors.

A) True **B)** False **C)** No information

26. AI helps reduce the total number of hospital visits for all patients.

A) True **B)** False **C)** No information

27. AI tools may unintentionally treat people unequally due to biases in their training data.

A) True **B)** False **C)** No information

28. One challenge with AI is knowing who is responsible if an AI system makes a medical mistake.

A) True **B)** False **C)** No information

29. The passage claims that AI should fully replace human medical judgment.

A) True **B)** False **C)** No information

Teacher Jamshid

READING PART 5

Read the following text for questions 30-35.

THE RISE OF SOLAR ENERGY

As the global demand for clean and sustainable energy sources increases, solar power has emerged as one of the most promising alternatives to fossil fuels. By converting sunlight into electricity through photovoltaic (PV) cells or solar thermal systems, solar energy provides a renewable solution with the potential to reduce greenhouse gas emissions and combat climate change.

One of the most attractive features of solar energy is its abundance. The Earth receives more energy from the sun in one hour than the entire world uses in a year. Harnessing even a fraction of this power could meet global electricity needs many times over. Modern photovoltaic technology allows solar panels to convert sunlight directly into electricity, while solar thermal systems use mirrors or lenses to concentrate sunlight and generate heat, which is then used to produce power.

In recent years, technological advancements have made solar energy more efficient and affordable. The cost of producing solar electricity has dropped significantly, making it competitive with traditional energy sources in many countries. Governments around the world have introduced subsidies, tax incentives, and feed-in tariffs to encourage the adoption of solar technologies. As a result, large-scale solar farms have been established in countries such as China, India, the United States, and Germany, while rooftop solar panels have become increasingly common in residential areas.

Despite its advantages, solar energy still faces several limitations. One major challenge is its intermittent nature; electricity generation depends on sunlight, which varies by location, time of day, and weather conditions. To address this issue, researchers are investing in advanced battery storage technologies and smart grids that can store surplus power and distribute it efficiently when sunlight is not available.

Another concern is land usage. Large solar installations require significant amounts of space, which can lead to conflicts with agricultural or natural ecosystems. In response, some developers are exploring dual-use models, such as agrivoltaics, where solar panels are installed above crops or grazing land to combine energy production with agriculture. Floating solar farms on reservoirs and lakes are also gaining attention as a way to reduce land competition.

Additionally, the production and disposal of solar panels raise environmental and ethical questions. Manufacturing PV cells involves mining raw materials like silicon and rare earth metals, processes

Teacher Jamshid

that can have negative ecological and social impacts if not managed responsibly. Furthermore, end-of-life recycling systems for solar panels are still in the early stages of development, prompting concern over potential waste in the future.

As solar technology continues to evolve, its role in the global energy transition is expected to expand. Collaboration between governments, industry leaders, and researchers will be crucial in overcoming technical and environmental challenges. If integrated thoughtfully into the wider energy system, solar power could play a central role in creating a cleaner and more sustainable future.

*For questions 30-33, fill in the missing information in the numbered spaces. Write no more than **ONE WORD** and / or **A NUMBER** for each question.*

Solar power can help reduce the amount of **30.** _____ released into the atmosphere, which contribute to climate change.

While PV cells generate electricity directly from sunlight, solar thermal systems rely on concentrated **31.** _____ to create heat.

Governments have supported solar adoption through financial mechanisms such as subsidies and **32.** _____. A dual-use approach called

33. _____ involves placing solar panels above farmland to allow both crop cultivation and energy production.

For questions 34-35, choose the correct answer A, B, C, or D. Mark your answers on the answer sheet.

34. What is one major reason solar energy is considered a powerful alternative to fossil fuels?

A) It can be produced at night using artificial light.

B) It provides a nearly unlimited source of energy.

C) It requires minimal space for large installations.

D) It works more effectively in colder regions.

35. What is the author's overall message in the passage?

A) Solar energy is a perfect replacement for all traditional energy sources.

B) The environmental costs of solar energy outweigh the benefits.

C) Solar energy has strong potential, but challenges must be addressed.

D) Only large nations can realistically invest in solar power.

Teacher Jamshid
